NOVELTY - A process of preparing a cosmetic composition is provided by  
using polymethylsilsesquioxane instead of an emulsifier which is easy  
to induce skin irritation. Whereby, the composition induces no  
photodermatoses, has excellent durability and can be easily removed.|  
AB- <BASIC> DESCRIPTION - Polymethylsilsesquioxane having an average  
particle size of 0.3 to 1.0 microns is dispersed in an oil component in  
an amount of 0.5 to 10% by weight, based on the total weight of the oil  
component and then introduced into an aqueous phase to give a stable  
water-in-oil emulsion in which polymethylsilsesquioxane particles are  
arranged on the interface between a water droplet having a size of 1 to  
10 microns as an inner phase and oil as an outer phase.|
